Vibe Code Developed Quick Start

💡 Overview

This guide and its subpages provide a practical starting point for first-time, new, or inexperienced developers to build enterprise-grade applications. It outlines common patterns, tools, and workflows to help you move quickly and safely; however, every solution must be tailored to specific business initiatives and requirements, so expect to adapt designs accordingly.

📋 Prerequisites

To kick off your development journey, please make sure you've completed the following prerequisites.

- [ ] Sleep Number VPN
- [ ] Local Admin
- [ ] Zscaler DevOps Group
- [ ] Azure Subscription
- [ ] GitHub

Docker

- [ ] Docker for macOS, or
- [ ] Docker for Windows (Not yet available.)

🚀 Next Steps

☕ Request Access

Sleep Number VPN

> To access Claude Code and related development services, you must first be connected to the Sleep Number corporate VPN.

- Navigate to https://sleepnumber.identitynow.com/ui/d/request-center/request-access
- Select "Request for Myself"
- Click "Entitlements" on the left menu
- Search for

```
VPNPRD_USER_SSO
```

- “Select” the group, enter in a comment like “Need to install software libraries to support”, then click “Save”
- Next, click “Review Request”
- Finally, click “Submit Request”

Local Admin - (Automated)

You will need to be granted (temporary) local administrator privileges to perform any actions that require elevated permissions (for example, installing software, SDKs, and development tools). This elevation is time-bound and will automatically expire after the approved window ends. When you need additional time in the future, you can submit a new Local Admin Rights request following the same process described below.

- Navigate to https://sleepnumber.service-now.com/sp
- Search for

```
Local Admin Rights
```

- Complete the form:
  - Select your system you need local admin
  - Enter the justification as “For local development”
- Next, click “Submit”

> You will receive an email with further instructions.

> You must be able to VPN into Sleep Number in order to get the temporary password you will need to elevate your privileges.

Zscaler DevOps Group - (Automated)

During certain local development and testing scenarios, you may need to temporarily disable Zscaler to avoid proxy or inspection interference with developer tools and local services. This elevation is time-bound and will automatically expire after the approved window ends.

- Navigate to https://sleepnumber.identitynow.com/ui/d/request-center/request-access
- Select “Request for Myself”
- Click “Entitlements” on the left menu
- Search for

```
ZscalerPRD_DevopsZTunnel_AppC
```

- “Select” the group, enter in a comment like “Need to install software libraries to support”, then click “Save”
- Next, click “Review Request”
- Finally, click “Submit Request”

> ⚠ Only disable Zscaler sparingly for specific development needs, and be aware that each disablement is time-boxed to a maximum of 15 minutes.

Azure

Access to Claude Code requires connection to the Sleep Number corporate VPN and access to the designated Azure subscription (`AIFoundryDEV_User_AppC`) .

- Access to `AIFoundryDEV_User_AppC` AD Group:
- Navigate to https://sleepnumber.identitynow.com/ui/d/request-center/request-access
- Select “Request for Myself”
- Click “Entitlements” on the left menu
- Search for

```
AIFoundryDEV_User_AppC
```

- “Select” the group, enter in a comment like “Need access to AI Foundry for Claude Code”, then click “Save”
- Next, click “Review Request”
- Finally, click “Submit Request”
- This will trigger an approval process that will be sent to Sandarsh Sridhar and Lukas Menne for approval

---

GitHub

Any code you create for Sleep Number must be stored in the company’s approved Git repositories. This ensures your work is backed up and discoverable, enables collaboration and supports proper version control and audit history, and allows the company to continuously scan and inspect code for potential security vulnerabilities or policy violations.

- Navigate to https://sleepnumber.identitynow.com/ui/d/request-center/request-access
- Select “Request for Myself”
- Click “Entitlements” on the left menu
- Search for

```
1 githubSleepNumberIncSCIMPRD_GithubRW_AppC
```

- “Select” the group, enter in a comment like “Need to maintain my code in a repo”, then click “Save”
- Next, click “Review Request”
- Finally, click “Submit Request”
- This will trigger an approval process that will be sent to Sandarsh Sridhar and Lukas Menne for approval

---

Docker - macOS

Docker is a containerization platform that packages your application and its dependencies into isolated, reusable containers. It is used to create consistent local development environments that closely mirror production, making it easier to build, run, and test services on your machine. By standardizing how applications are built and deployed, Docker improves reliability, simplifies onboarding, and reduces “works on my machine” issues. When your services are ready for deployment, Docker images can be integrated into CI/CD pipelines so that code and dependencies can be continuously scanned and inspected for potential security vulnerabilities or policy violations before and after they are promoted to higher environments.

> Once you have completed all prerequisites above, follow these steps to install and configure the Docker development environment on macOS.

- Open Terminal on macOS.
- Choose or create a working folder (e.g., ~/code) and switch into it:

```
1 mkdir -p ~/Documents/Github && cd ~/Documents/Github
```

- Clone the Dockyard repository:

```
1 git clone https://github.com/SleepNumberInc/Dockyard.git
```

- Change into the Dockyard directory:

```
1 cd Dockyard
```

- Make the macOS setup script executable:

```
1 chmod +x setup-macos.sh
```

- Run the macOS setup script:

```
1 ./setup-macos.sh
```

- Follow on-screen prompts until the script completes (approve installs/permissions as requested).
- Restart Terminal (or open a new window) to load environment changes.
- Verify the install using any post-install checks in Dockyard README.md

---

Docker - Windows

> *This section is still a work in progress and content may change.*

🏈 Next Steps

Once the prerequisites are setup and running go through the following next steps

- [ ] Azure Login
- [ ] Claude Setup for macOS
- [ ] Claude Setup for Windows
- [ ] Visual Code Studio (IDE)
